AB - PURPOSE: To provide an exchange maintenance system with superior serviceability by suppressing the modification part of an application program for the specification change and version revision of a targeted exchange to a minimum.

- CONSTITUTION: This system is constituted in such a way that a function to define a processing function used commonly to an exchange specification dependence processing part and an abnormality processing part as an independent program as many as possible from the service job program of an application plane 20 is provided. When the change of subscriber data is instructed by a maintenance terminal, a subscriber data change service job program takes out subscriber information in common information, and generates a command to execute data change. Subscriber data change service can be performed by starting up the system and designating a subscriber data change address and application data to a command application program to an exchange registered in advance as a common component 40. Therefore, the development and debug of the program can be easily performed.
